

# SUMMER OF TECH

2017

Mobile First Development

# Logan Elliott - @L0gyb

I am a Full stack developer with experience doing:  
Angular, C#, React, React Native, CI/CD...

I work at Vista Entertainment Solutions

# Mobile First Development!

Who has made a desktop website/app?

Who has made a native app?

Who has never used HTML/CSS/JavaScript?

# Where is Mobile development going?

Native apps are dead

Progressive Web Apps are the future

# . \* First Development

# Desktop Website

Why?

- No mobile users
- Usually made before mobile!

Pros:

- Cheap

Cons

- Not responsive to screen size
- Usually has pages you have to click links to get to

Result: Poor mobile experience!

Example: <http://www.sailone.co.nz/>

# Responsive Website

Why?

- You want mobile users...

Pros:

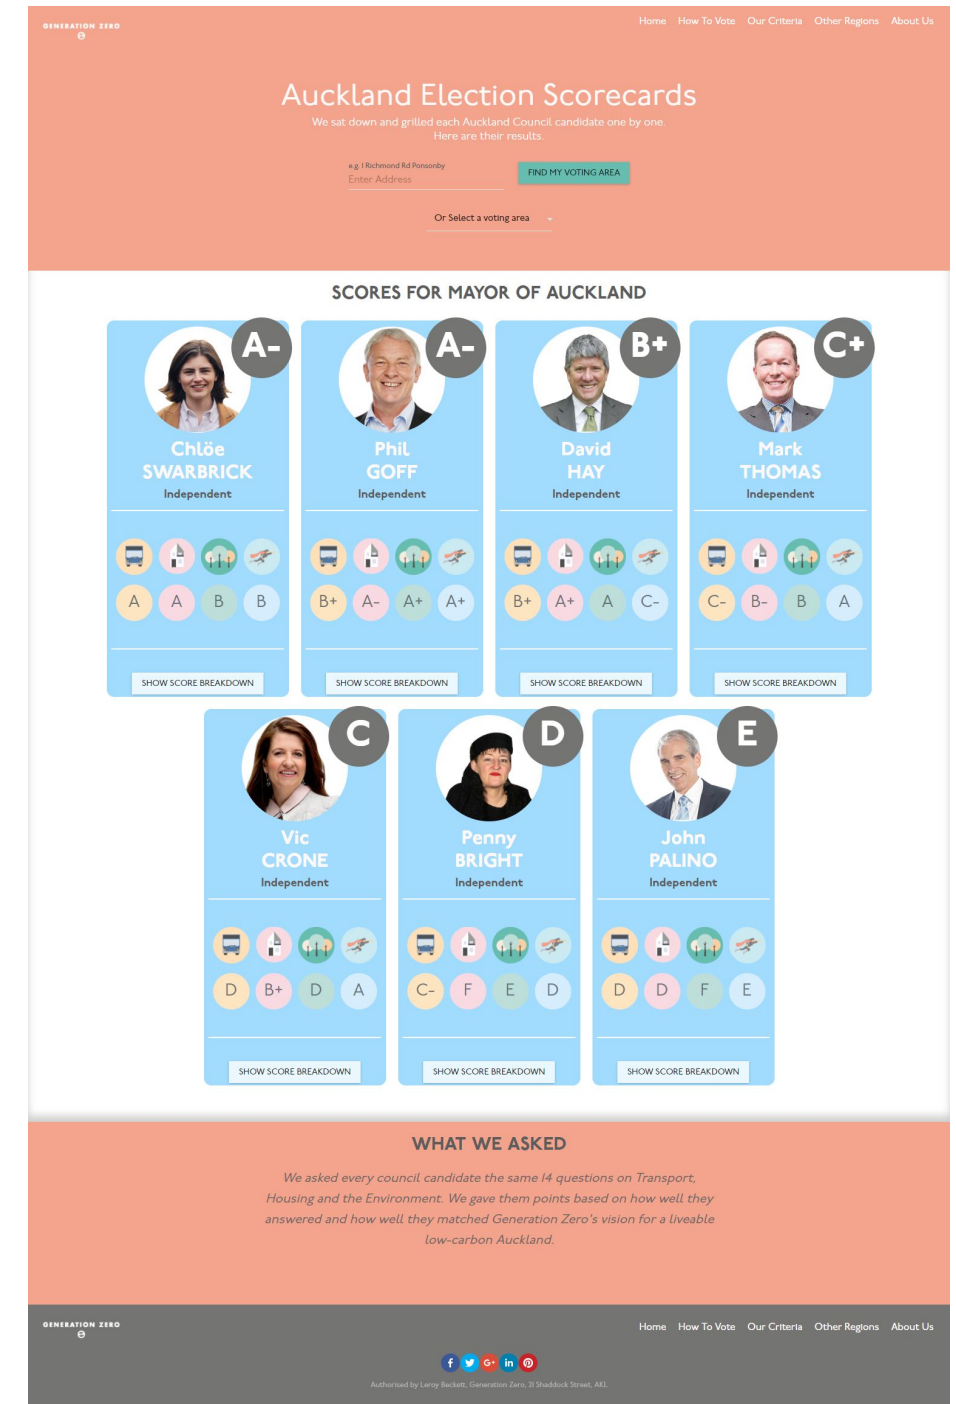

- Changes to suit your screensize
- Can be a Single Page App
  - Interactive rather than url based
- ~Good~ experience on mobile

Cons:

- Quality can vary a lot
- Expensive because you still might have to make an app
- Bad ones typically don't have the same features as the desktop site :(

Result: Useable on mobile, could be better

Example: <http://aucklandelections.nz/>

# Making a website responsive in css

```
.candidate-breakdown {  
  width: 616px;  
  border-radius: 12px;  
  padding-bottom: 8px;  
  
  @media screen and (max-width: $small) {  
    width: 300px;  
  }  
}
```

This makes the breakdown section of the card 300px wide instead of 616px wide

<https://github.com/LoganElliott/aucklاندelections/blob/master/src/components/candidateBreakdown/candidateBreakdown.scss#L3>

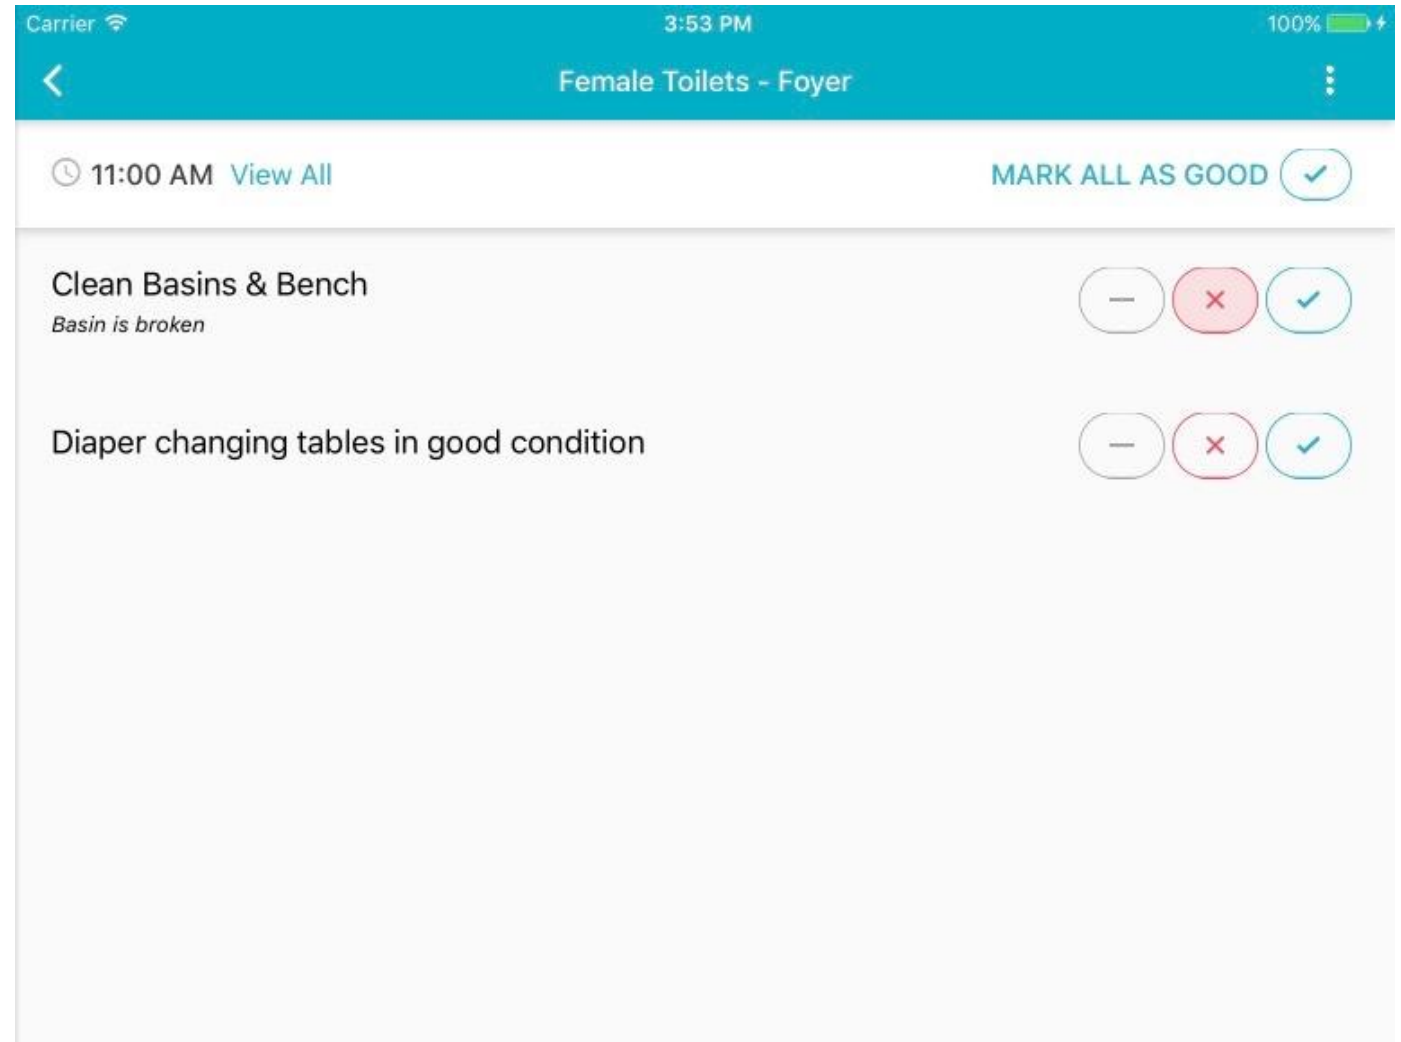

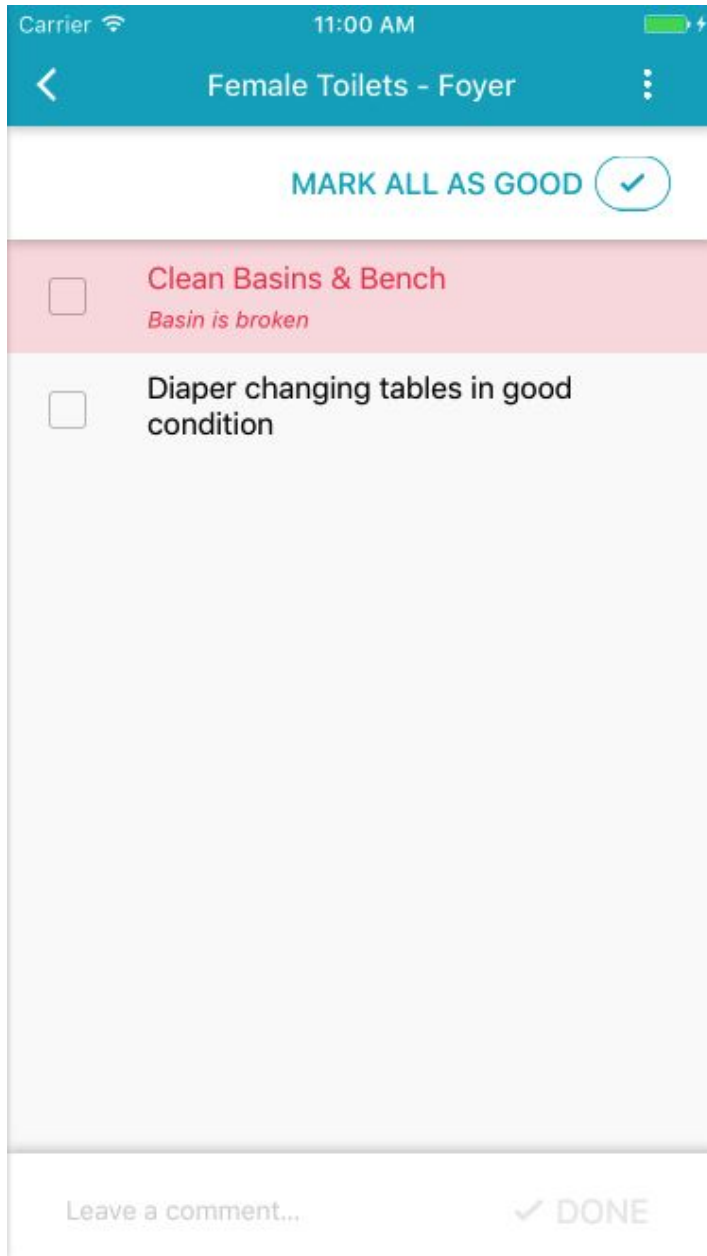

# Simple example making a website responsive in javascript

```
const screenSize = window.innerWidth;
const desktopSize = 700;
const tabletSize = 350;
const mobileSize = 200;
if (screenSize > desktopSize) {
    return <div >
        Desktop View!
    </div>
} else if (screenSize > tabletSize) {
    return <div >
        Tablet View!
    </div>
} else {
    return <div >
        Mobile View!
    </div>
}
```

This renders a different sized div depending on how big the screen is

<https://jsfiddle.net/m1cm5L3d/5>

# Real life Javascript mobile/tablet responsive design

# Native (IOS/Android/Windows)

Why?

- You really want mobile users

Pros:

- Changes to suit your screensize/device
- Can use phone hardware
- Great user experience

Cons:

- Expensive, you need to make per platform
- You still need a website
- Very complicated dealing with lots of different versions/devices

Result: Really good experience on mobile, but quite time consuming to make

Example: Twitter, Gmail, most apps you use

# Hybrid Native App (React Native/Ionic)

Why?

- You want mobile users but aren't made of money/time

Pros:

- Changes to suit your screensize/device
- Can use phone hardware
- Great user experience
- Build once run anywhere™®
- Hypothetically can share code with website

Cons:

- You still need a website
- Very complicated dealing with lots of different versions/devices
- Still need some knowledge of native apps (e.g. Android/iOS permissions)
- Somewhat bleeding edge
- Not very functionally complete... I hope you like writing libraries
- Continuous Integration/Deployment/Testing is hard

Result: Really good experience on mobile, hard to develop, still need a website

# . \* First Development

# Progressive Web Apps

Why?

- You want to make mobile & desktop users happy

Pros:

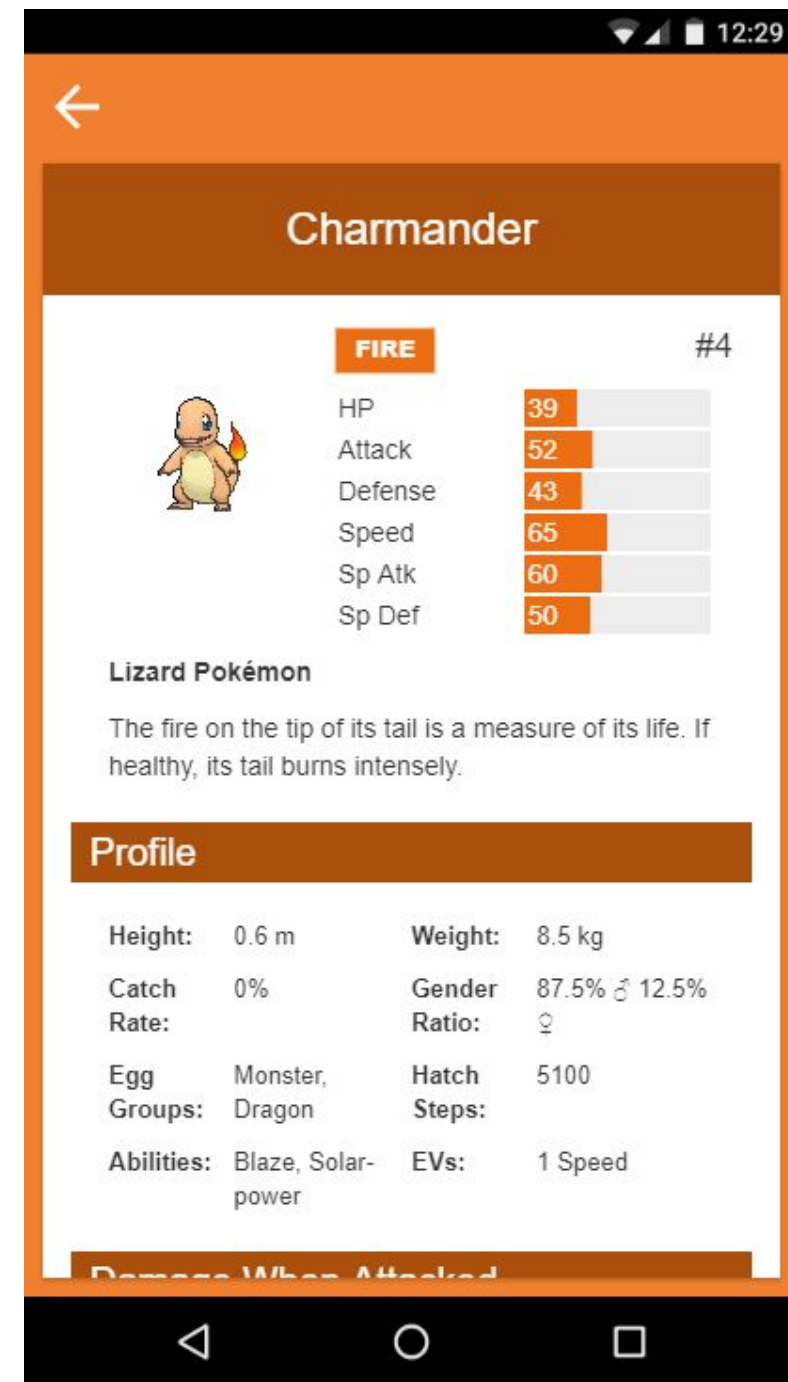

- Changes to suit your screensize/device
- Great user experience
- Build once run anywhere™®
- Easy to deploy & update
- mostly uses existing technology, don't need to reinvent the wheel for libraries
- Hardware control

Cons:

- Safari doesn't really work...
- Bleeding edge

Result: Really good experience on mobile, doesn't work everywhere yet

Example: <https://pwa.rocks/>

# Why isn't everyone doing a Progressive Web App?

Native apps are almost\* dead

Currently Safari doesn't really support most of the best parts of progressive web apps.

<https://whatwebcando.today/>

<https://caniuse.com/#search=getUserMedia>

<https://jakearchibald.github.io/isserviceworkerready/index.html>

# Mobile App comparison slide

	Great User Experience	Build Once run everywhere	Complex Cross Platform	Bleeding Edge	Hardware support
Desktop Website	N	M	N	N	N
Responsive Website	M	M	N	N	N
Progressive Web App	Y	Y	N	Y	M
Hybrid App	Y	M	Y	Y	Y
Native App	Y	N	Y	N	Y

# Why do we care so much about mobile users?

## Internet Usage Worldwide

October 2009 – October 2016

■ Desktop ■ Mobile & Tablet

# So what makes a website a PWA?

According to Google they are:

- **Reliable** - Load instantly and never show the downasaur, even in uncertain network conditions.
- **Fast** - Respond quickly to user interactions with silky smooth animations and no janky scrolling.
- **Engaging** - Feel like a natural app on the device, with an immersive user experience.

<https://developers.google.com/web/progressive-web-apps/>

# Ok so what do I need to add to my website to achieve that?

See

<https://developers.google.com/web/progressive-web-apps/checklist> ...

Or just use the automated tool lighthouse...

<https://chrome.google.com/webstore/detail/lighthouse/blipmdconlkpinefehnmjammfjpmpbjk>

# Lighthouse in action

Lets see what I need to do to make my <http://aucklandelections.nz/> a better PWA...

WHAT WE ASKED

We asked every council candidate the same 14 questions on Transport, Housing and the Environment. We gave them points based on how well they answered and how well they matched Generation Zero's vision for a liveable low-carbon Auckland.

Authorised by Leroy Buckett, Generation Zero, 21 Shadlock Street, AKL.

# Lighthouse in action

Lets see what I need to do to make my <http://aucklandelections.nz/> a better PWA...

Main things I am missing:

- Offline support
- Manifest file
- HTTPS

# Making a new app

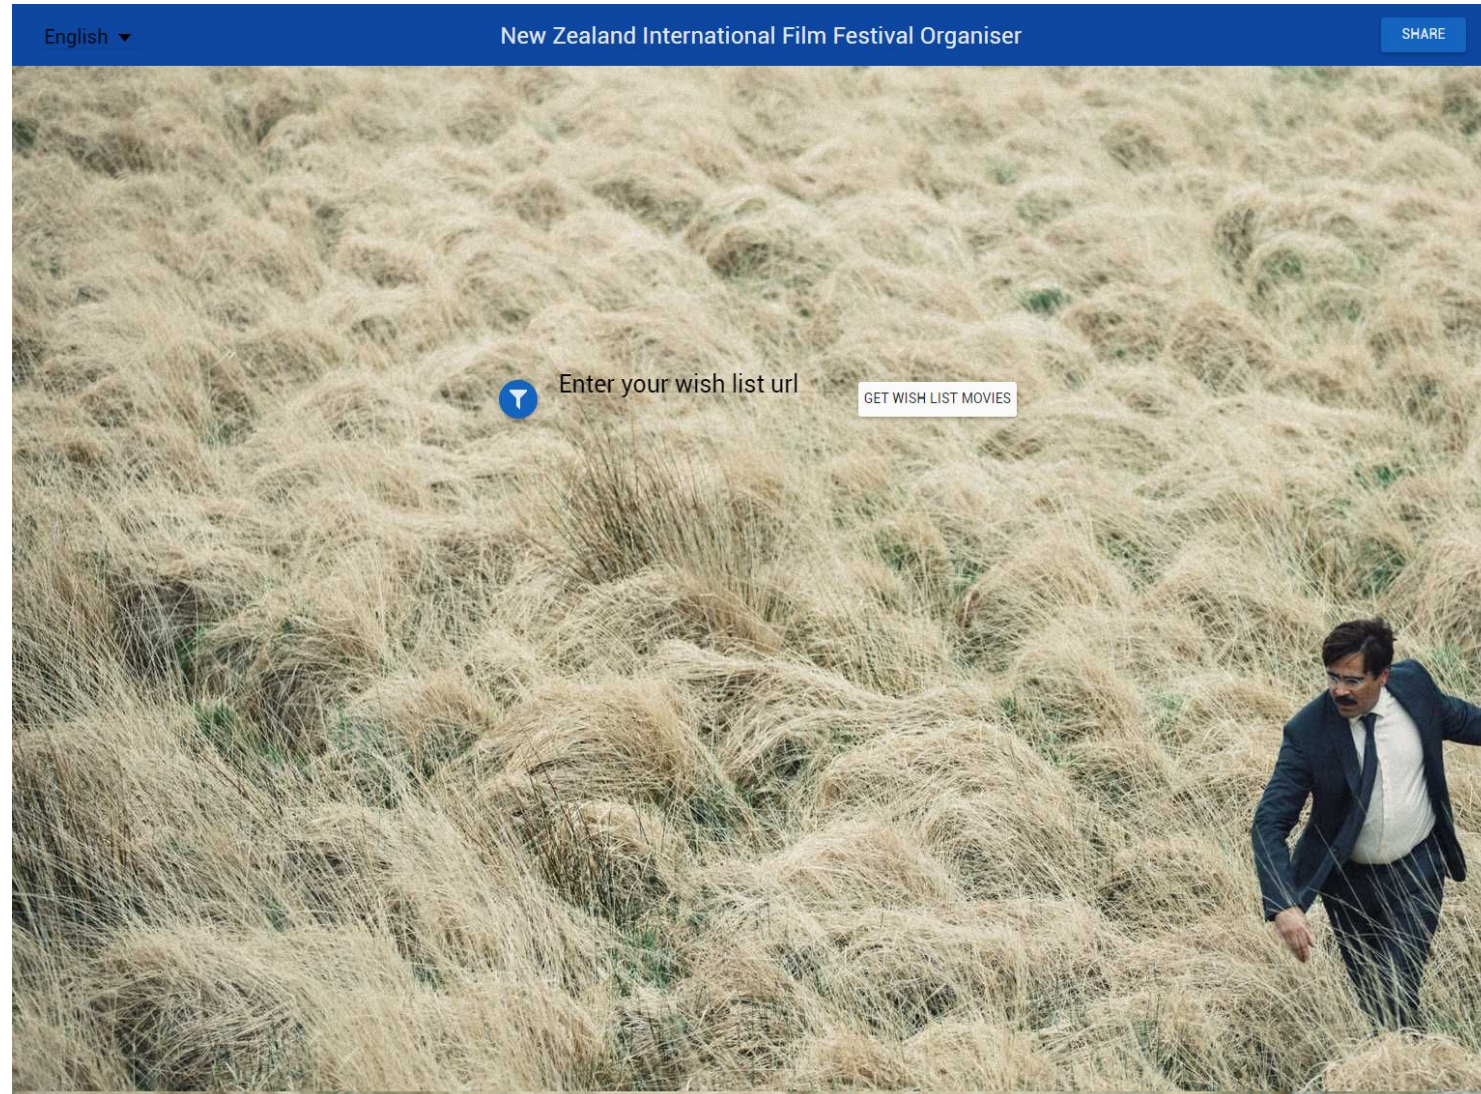

What to think about when making a new app or modifying an existing one

Design is key!

# New Zealand Film Festival App

<http://www.loganelliott.space/nziffo/>

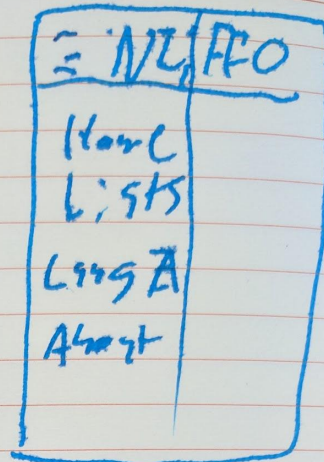

# New Zealand Film Festival App

- Old app, old technology (Angular 1 ☐)
- No offline mode
- Average design

Mobile

Desktop

Mobile

Desktop

# Design is first principle

What makes a good mobile first design?

- Be focused: More is not better
- Be your user: You should enjoy your apps experience
- Know your use case: What is the purpose of this app?
- RESPONSIVE

<https://www.thinkwithgoogle.com/marketing-resources/experience-design/principles-of-mobile-app-design-engage-users-and-drive-conversions/>

# Design is first principle

## Iterative vs Incremental

A good design is incremental, users will help you make it better!

Not like this....

Like this!

# What does responsive mean?

## Why care?

If your page doesn't load people aren't going to see it...

<https://blog.kissmetrics.com/loading-time/?wide=1>

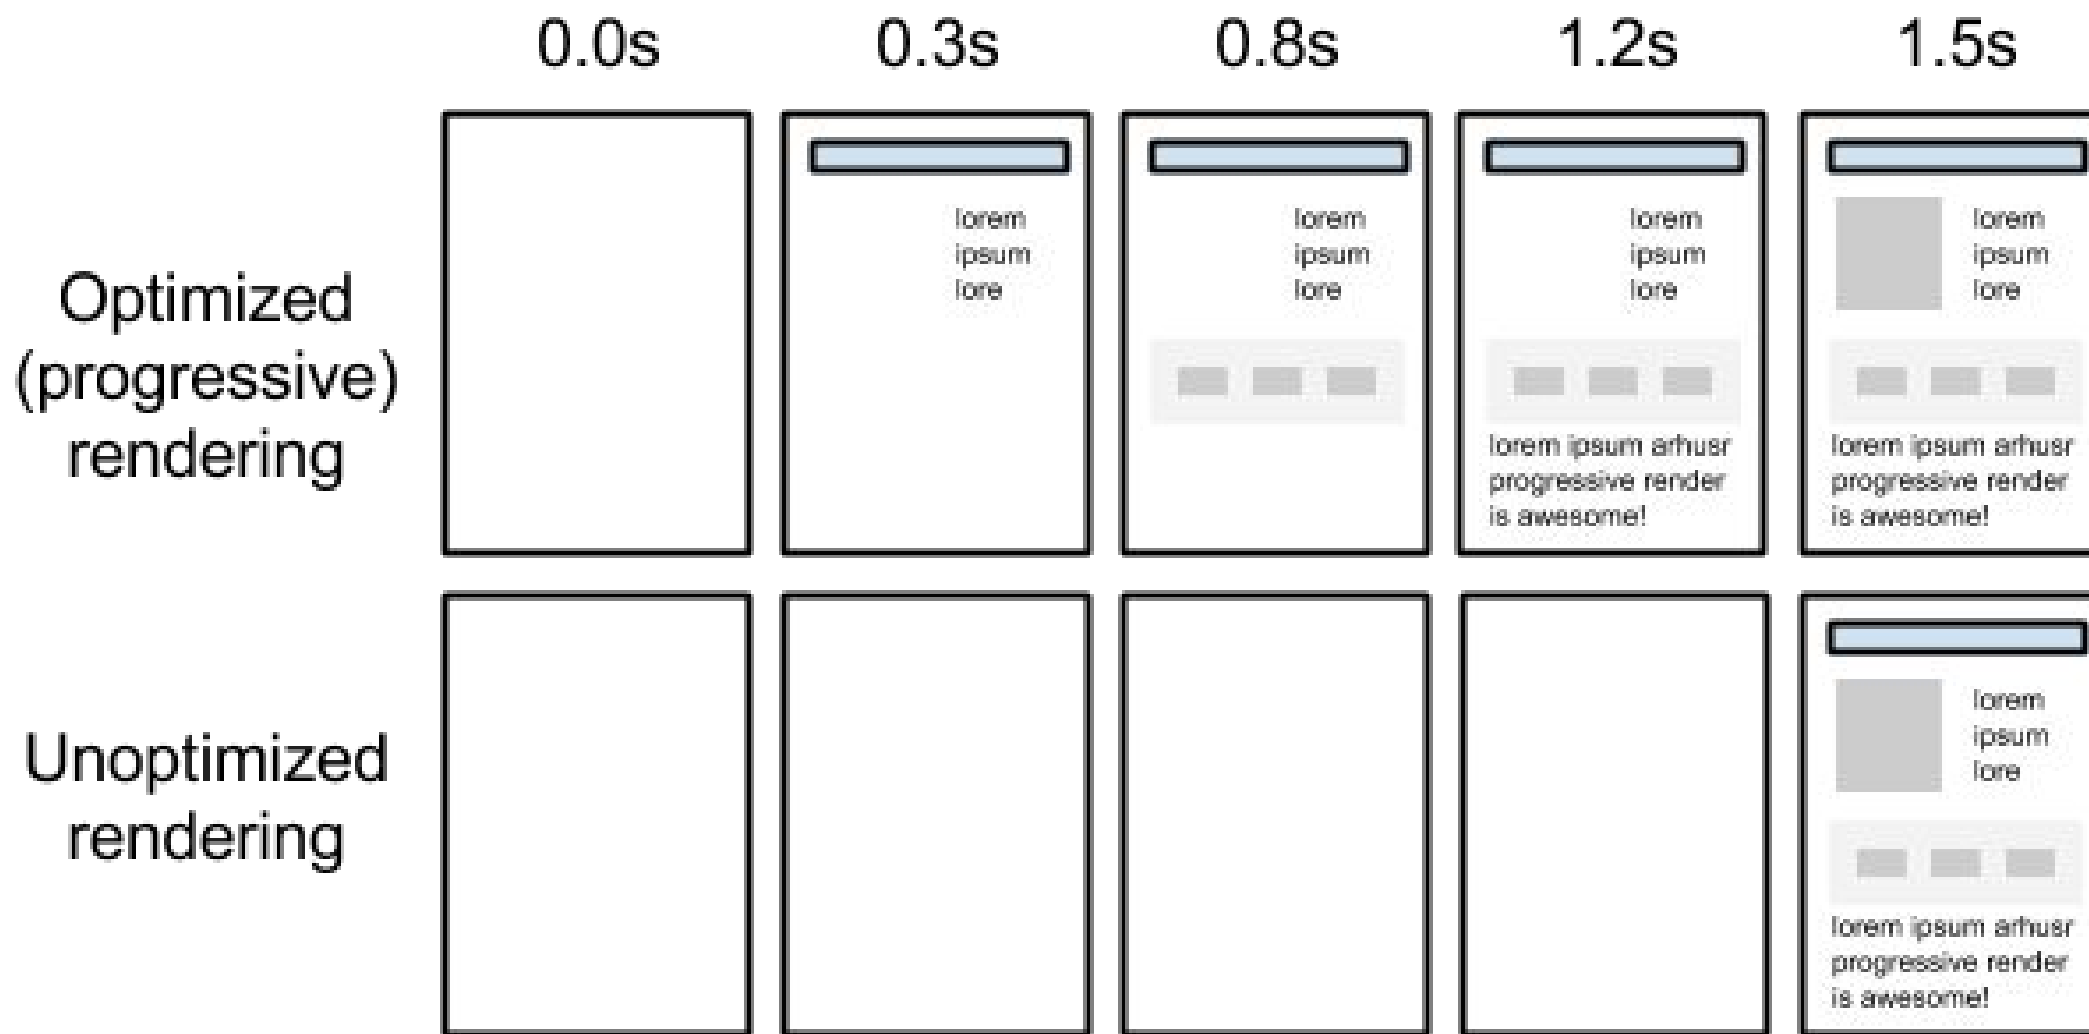

### PATIENCE OF MOBILE WEB USERS

How long are users willing to wait for a site to load before they abandon the page? The following graph seeks to answer this question.

Observation: Most participants in the survey would wait 6-10 seconds before they abandon pages.

# First Meaningful Paint

<https://developers.google.com/web/fundamentals/performance/critical-rendering-path/>

[Slack is a really good example of this](#)

# Example!

<https://www.pokedex.org/>

# Development tools for webapp dev

<https://developers.google.com/web/tools/chrome-devtools/>

# Mobile first development Summary

- Progressive Web Apps are the future for mobile
- Know your users, help direct their focus
- Good design is key to a good app
- A good design is incremental, users will help you make it better

# Web app live demo and deployment

Let's make and deploy a super simple webapp!

Don't worry if there is a lot you don't understand.

# npm

npm is a way to use other people's packages

<https://docs.npmjs.com/getting-started/what-is-npm>

<https://www.impressivewebs.com/npm-for-beginners-a-guide-for-front-end-developers/>

# React

What is react?

React is a declarative, efficient, and flexible JavaScript library for building user interfaces.

<https://facebook.github.io/react/>

# create-react-app

This is a super easy to use npm package that hides most of the hard painful stuff with front end development

<https://github.com/facebookincubator/create-react-app>

# create-react-app

This is a super easy to use npm package that hides most of the hard painful stuff with front end development

following

<https://github.com/facebookincubator/create-react-app#getting-started>

We run

1. `npm install -g create-react-app`
2. `create-react-app sot-app`
3. `cd sot-app`
4. `npm start`

# Simple example making a website responsive in javascript

```
const screenSize = window.innerWidth;
const desktopSize = 700;
const tabletSize = 350;
const mobileSize = 200;
if (screenSize > desktopSize) {
    return <div >
        Desktop View!
    </div>
} else if (screenSize > tabletSize) {
    return <div >
        Tablet View!
    </div>
} else {
    return <div >
        Mobile View!
    </div>
}
```

This renders a different sized div depending on how big the screen is

<https://jsfiddle.net/m1cm5L3d/5>

# So we have a app running locally

That's all well and good but what if you want to show some else your new cool site?

Send a video...?

# Github pages!

My Auckland Elections website is hosted on github

<https://github.com/LoganElliott/aucklاندelections/tree/gh-pages>

Github pages info

<https://www.thinkful.com/learn/a-guide-to-using-github-pages/>

<https://guides.github.com/features/pages/>

# Github pages

Let's host our new app on Github!

following

<https://github.com/facebookincubator/create-react-app/blob/master/packages/react-scripts/template/README.md#github-pages>

```
'npm install gh-pages --save-dev'
```

Make a github repository

<https://github.com/new>

initialise our current folder as a git repo 'git init'

```
'npm run deploy'
```
